The Simple Problem Mathematicians Got Wrong.

Introduction

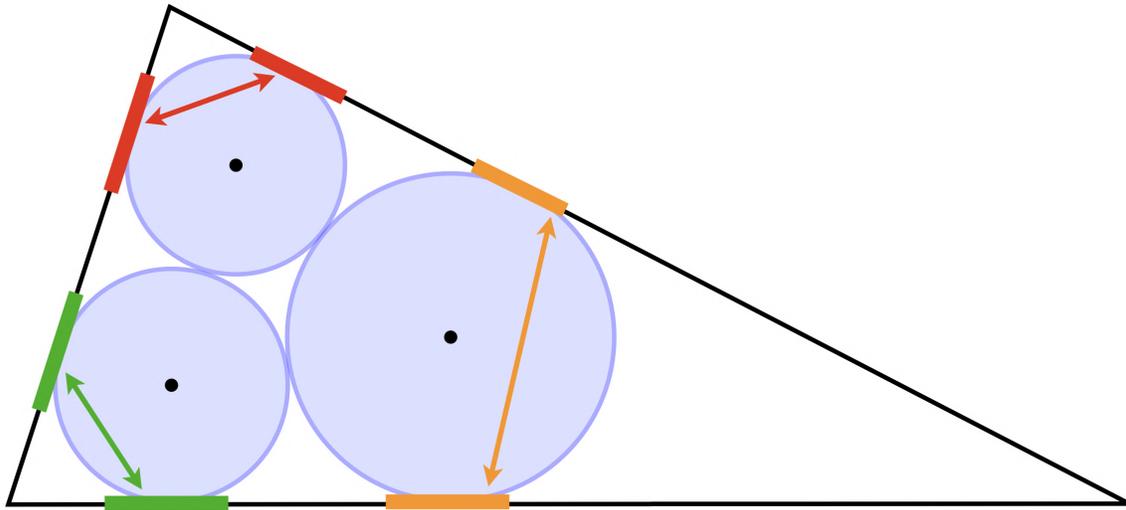

There's a very simple problem that for 100 years, mathematicians just accepted as solved, and yet, no one seemed to question if that solution was really right. Turns out... it wasn't. And there's a version of it that still hasn't been solved to this day.

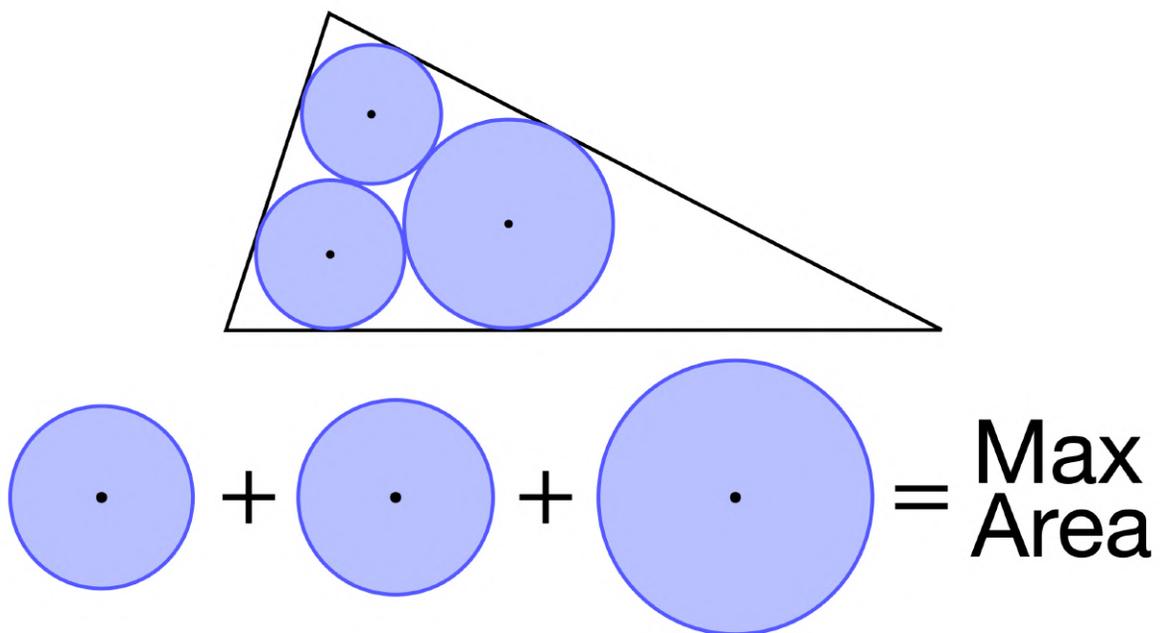

It is the problem of **Malfatti circles**. Imagine 3 non-overlapping circles

inside a triangle, each of which has to touch its neighbors, and each of which has to touch two sides of the triangle.

It was believed that any 3 such circles, inscribed within a triangle, would together *maximize the total area* of the 3 circles.

And intuitively, they do look optimal. But... they're not. And the worst part? The proof that they aren't is not even that complicated.
